

Top 5 Reasons

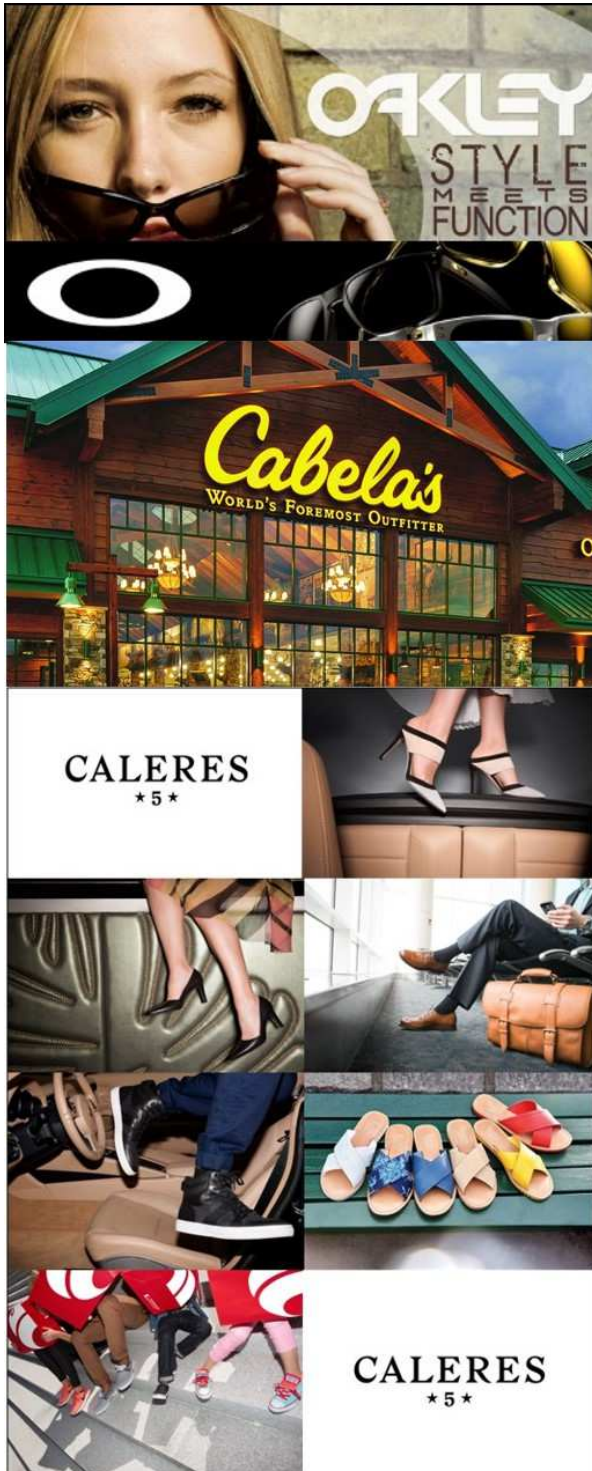

DC Professionals Choose
AccuSpeechMobile

1. Mobile “Server-Less” WMS Voice Productivity

“AccuSpeechMobile’s mobile architecture lets us add voice control productivity and optimization to existing WMS applications with faster ROI by avoiding the high costs associated with older server-based solutions.”

The AccuSpeechMobile solution is a completely mobile voice solution that delivers voice control for existing commercial or custom-built WMS applications - solely from the mobile device. It's advanced mobile architecture eliminates any need for server-based integration of proprietary WMS applications. Customer applications are voice-enabled from their DC workforce's mobile devices – leaving existing applications and server infrastructure untouched.

Most DC Professionals evaluate options balancing risk and costs vs potential gains in operational improvements.

AccuSpeechMobile customers like *Oakley*, *Caleres*, *Colony Brands* saw the opportunity to improve productivity, increase accuracy and optimize their existing applications – avoiding the high costs and complexity of server-based voice integration and necessity to change or replace their existing business processes.

2. Make Existing Investments Faster, Stronger, Better

“We achieve the added workforce productivity, cost savings and optimization we needed without risking or replacing our existing distribution investments and architecture.”

This advance mobile voice architecture by design – impacts every dimension of deploying voice productivity.

A mobile server-less architecture impacts economics with a TCO at a fraction of older technologies, scalability across scores of applications, not just one or two. It provides customer control over optimizing existing investments across DC operations – placing control in the hands of customer, not vendor professional services. For our customers its a compelling solution that makes their existing investments faster, stronger, better, without changing or replacing or replacing them.

Cabela's Outfitters has deployed voice for virtually all their existing distribution processes – **15** applications across their 5 national DC's and **75** retail stores. *Oriental Trading* has voice-enabled **36** applications across receiving, stocking and inventory applications.

3. Customer Control Not Costly Vendor Control

“Our team once trained to use the AccuSpeechMobile laptop-based voice enabling and automation console, gave us the control to voice-enable and optimize our DC applications – freeing us from the high costs of professional services.”

The advancement of mobile voice productivity complements the voice deployment of voice productivity – by giving DC professionals control over deployment – freeing them from dependence on expensive professional services associated with older server-dependent technologies.

The solution’s device-based Intelligent Voice Client is customized by the laptop based Voice-Enabling and Automation Console.

The AccuSpeechMobile team collaborates with our customers to train them to voice optimize and automate their own existing applications.

Most all our customers, *RIDGID Tools, Colony Brands, Houghton Mifflin Harcourt, Cabela’s, Caleres, Oakley* and other have their own internal teams already ***trained by AccuSpeechMobile personnel – allowing users to deploy voice wherever they want – on their own timetable.***

Because of the AccuSpeechMobile architecture, when business operations change our customer’s internal teams can make voice-changes to their applications in minutes and hours.

4. Mobile Automation of Existing WMS Apps

“Truly surprising. A mobile seamless voice capability that triggers our mobile devices to execute multiple application functions automatically in seconds, skipping unnecessary navigation, speeding through processes – eliminating worker intervention – automating our apps without changing our code.”

The AccuSpeechMobile Voice Solution takes voice control to yet another level.

The Intelligent Voice Client – tied to the device’s operating system – with a single voice utterance – can trigger the device to execute multiple application functions – streamlining unnecessary navigation, function screens and executing many application functions in seconds.

Voice automation Increases accuracy, data integrity and with even faster operations - seamlessly, ***without changing application or multi-application code.***

The AccuSpeechMobile mobile voice logic allows the device, where appropriate, to eliminate worker intervention. Providing automated device-executed application and cross application functions in seconds.

Oriental Trading has reduced receiving functions from 10 functions to 2 worker required functions. *Cabela’s* has reduced the time of pick-to-replenish functions to 2 seconds. *Caleres* has already automated their picking systems supporting Omni-Channel fulfilment.

5. Max Productivity, Low Cost, Fast ROI

“Once we collaborated with the AccuSpeechMobile team, during web meetings, on the floor during our POC and in deployment -- we fully understood all the capabilities of this mobile solution – I can’t imagine why we would choose any other approach.”

The mobile voice architecture in modern distribution, eliminates server integration from the equation completely. Changing the economics behind voice productivity.

Once customers are liberated from the risk-reward problem of older voice technologies that make their already complex back-end distribution system even more complex – they are free to deploy voice productivity where and when they want – containing costs and achieving fast ROI.

The question for distribution professionals – “if I can deploy WMS voice productivity everywhere, seamlessly from a mobile platform, avoid changes to my apps and infrastructure contain my costs – and retain total control -- **why would I want to choose any other approach.**”

Learn More – Discover More

In this contemporary age of distribution center operations – modern mobile technologies have changed the optimization options for distribution professionals. Advances in mobile technology should be deployable by majority of businesses not the minority. Advanced mobile capability – should also drive down acquisition costs, and add value to your existing investments.
